TITLE: Spring wire from stainless steel

SOURCE: Stal', no. 4, 1966, 379-383

TOPIC TAGS: stainless steel, spring, mechanical property, wire product, magnetic property

ABSTRACT: The authors study the effect of the chemical composition and specific production factors of various varieties of stainless steel on mechanical and magnetic properties of wire during drawing. The results of the study show that it is necessary to suppress the $\gamma \rightarrow \alpha$ transformation in order to produce spring wire from stainless steel which has a minimum α -phase content and high ductility. This suppression can be accomplished by increasing nickel content from 10.5 to 11.0%, maintaining minimum titanium content of not more than 5 (C-0.02)%, maintaining austenization temperatures (1050-1100°C) and multiple-pass drawing at speeds not exceeding 150-200 m/min. Nevertheless, the production of wire from Kh18N10T steel which contains nickel at the upper limit given by GOST 5632-61 does not guarantee attainment of the strength requirements. This

Card 1/2

UDC: 621.771.42

ACC NR: AP6022512

makes it necessary to select a metal with an average nickel content of 9.6-10.0%. The result of this is that the α -phase content is increased in the wire. Good results can be expected from steel with a nonstandard titanium content up to 0.3%. In this case, the selection of a metal at the upper limit with respect to carbon content (0.10-0.12%) would improve strength and lower the quantity of the α -phase along with alloying austenite with a certain amount of uncombined carbon. Wire produced in this manner should be sufficiently stable with respect to intercrystalline corrosion. Greater strength and higher ductility with low α -phase content can be obtained by making wire from steel not alloyed with titanium. At the same time, carbon content does not have to exceed 0.05-0.8% to prevent intercrystalline corrosion. While the limitations with respect to α -phase concentration do not conform to a given set of rules, still the strongest wire can be produced by work hardening alloyed austenite and by the $\gamma \rightarrow \alpha$ transformation during drawing. In doing this, steel must be used which is not alloyed with titanium and has a minimum amount of nickel (8.0-8.5%) and (17-18%) chromium. It must also contain a relatively small amount of carbon (0.06-0.10%). Drawing must be carried out with relatively small reductions at low drawing rates and with adequate cooling before proceeding with the next stage of deformation. Orig. art. has: 6 figures, 1 table.

Title : Concerning pathogenic therapy in cases of gastro-intestinal colic in horses.

Periodical : Veterinariya, 10, 52-55, Oct 1954

Abstract : Intravenous injection of 10% solution of sodium bromide in combination with caffeine produced positive effects in majority of 20 horses treated for gastro-intestinal colic. The therapeutic effect of bromide-coffee mixture depends on the type of nervous activity in each individual case and on the condition of the nervous system at the time the bromide-coffee treatment was inaugurated. Since there are many causes of gastro-intestinal colic and since there are different courses that the disease may take, treatment must not be limited to intravenous injection of bromide-coffee mixture: physical therapy, laxatives, and diets may produce the desired results.

A complex-valued function f , defined in body T , of a set is called additive in this body if $f(E_1 + E_2 + \dots + E_n) = f(E_1) + f(E_2) + \dots + f(E_n)$ holds for any finite number of nonintersecting sets of this body, where any system of subsets of set R (certain abstract set) is called a body T from "tel" meaning "body" if the sum and difference of

Title : Vaccination of Pigs Against Hoof-and-Mouth Disease.

Orig Pub : Tr. Vses. in-ta eksperim. veterinarii, 1957, 20, 54-62.

Abstract : The anti-hoof-and-mouth disease vaccine VIEV imparts to vaccinated pigs a sufficiently strong immunity against infection by the virus, and is an effective bioproduct for specific prophylaxis of this disease in pigs. Timely prophylactic vaccination of pigs, conducted on farms where hoof-and-mouth disease has appeared among cattle, prevents the infection of the pigs. Conditional vaccination of healthy pigs in pigstys contaminated by

hoof-and-mouth disease provides positive results under the condition of simultaneously implementing veterinary sanitary measures. On contaminated farms, in cases of continuation of illness with hoof-and-mouth disease among vaccinated pigs beyond the 8 - 10th day from the time of their vaccination, or the reappearance of illnesses after the indicated period, it is necessary to vaccinate the pigs repeatedly with the previous dosages, which prevents the further spread of disease and aids the sanitation of the farms. With vaccinations of pigs with a vaccine with a 2% content of the original virus material, it is necessary for reliable immunization to conduct a double inoculation of the vaccine with an interval of 7 - 8 days.
